

Gonka x ADI: Sovereign AI Inference on Abu Dhabi's Digital Rail

One-pager for ADI Foundation / Sirius International Holding · September 2026 · Draft for discussion

The idea in one line. ADI Chain becomes the regulated settlement and verification layer for Gonka's decentralized AI inference network, the way BNB Chain became a home for pegged USDC: not a takeover, a deep integration that brings a live AI workload, a developer audience, and GPU economics onto ADI, while Gonka gains a dirham-settled, institution-grade rail into the Middle East, Africa and Asia.

What Gonka is (facts as of July 2026)

- Decentralized AI inference network. ~98% of network compute does real AI work (Sprint Consensus proof-of-compute), not idle hashing.
- \$80M+ raised from Coatue and Bitfury Capital. Hosts include Gcore, Hyperfusion, 6blocks; GAIB runs turnkey H100/H200/B200 node operations. CertiK audits.
- OpenAI-compatible API, so any existing app or agent framework switches with a base-URL change. Serves frontier-class open models (Kimi K2.6 / K3 tier) at a fraction of closed-API prices.
- GNK token pays for inference and rewards GPU hosts. ~1,200 GPUs live today, so per-GPU mining share is high relative to the announced peak.

Why this fits ADI's three capabilities

ADI pillar	What Gonka adds	Concrete deliverable
Settle	A real, recurring payment flow (inference fees) settled in DDSC and GNK on ADI Chain	GNK issued on ADI Chain (bridged/wrapped), DDSC↔GNK liquidity, institutions pay for AI in dirham
Operate	A dedicated "sovereign AI zone": Abu Dhabi-hosted GPUs serve UAE and partner-market inference with data residency	Permissioned Gonka host cluster in ADI-approved datacenters, exposed as an ADI digital environment
Verify	Every inference is proof-of-compute verified; receipts can be anchored to ADI as trusted records	"Verifiable AI" audit trail for government, energy, trade and claims workflows, without publishing prompts or data

Four practical integration tracks

- GNK on ADI Chain (settlement).** Deploy a bridged GNK asset on ADI Chain (Gonka already bridges GNK to Ethereum; if ADI Chain is EVM-compatible the contracts port directly). A licensed ADI participant custodies the bridge, consistent with ADI's "institutions provide the regulated service" model. Pair with DDSC so a bank, port or ministry buys AI compute in dirham and never touches a crypto exchange.
- Abu Dhabi inference cluster (operate + earn).** Sirius/IHC datacenter capacity runs Gonka nodes. Two revenue lines: GNK mining rewards on every epoch plus inference fees from real traffic. GAIB's private batch (200+ H200) reported \$600K+ in its first phase; at today's ~1,200-GPU network a 500-GPU cluster is a top-tier host with proportional reward share. Hardware is standard H100/H200/B200; no custom silicon.
- "AI on ADI" developer distribution (promote the chain).** Publish an ADI-branded inference endpoint and MCP server that any agent can call, paid in DDSC via x402-style agent payments (x402 Foundation members include Visa, Mastercard, AWS, Coinbase). ADI becomes the first regulated chain where an AI agent buys compute in a central-bank-approved stablecoin. Gonka's developer channels (OpenClaw provider listing, MCP Registry, gateways like JoinGonka) carry the ADI name worldwide.
- Verifiable AI records (verify).** Anchor inference proofs to ADI for regulated use: an energy allocator, a trade-document classifier or a claims model can show *which model, which input hash, which verified host* produced a decision. Extends ADI's Good Energy pattern (113M+ records, private data stays with the owner) to AI outputs.

What each side gets

ADI / Sirius / IHC. A live, high-frequency workload on ADI Chain from day one. GPU assets that earn in two currencies. A global developer story ("AI runs on ADI") beyond institutional settlement. A sovereign AI capability for UAE, AfCFTA corridor and Asian partners. Optional: strategic GNK position at a ~95%-below-ATH entry, comparable to Bitfury's 2025 strategic round (terms to be negotiated).

Gonka. Dirham-denominated institutional demand. A compliant fiat on-ramp via DDSC. Datacenter capacity in a jurisdiction with regulatory clarity. Access to IHC's 1,300+ portfolio companies as inference customers and to ADI's 50+ partnerships.

90-day pilot (mapped to ADI's Define → Design → Pilot → Scale)

Weeks	Step	Success criterion
1–2	Define. Pick one workflow: e.g. document classification for an AfCFTA corridor pilot or an IHC portfolio company's customer-support agent	Named participants, volume estimate, data-residency rules agreed
3–6	Design. Bridge spec for GNK on ADI Chain, custody partner, DDSC↔GNK pricing, host-cluster sizing (start 64–128 GPUs)	Signed technical scope, regulatory review started
7–12	Pilot. Cluster live, endpoint live, first DDSC-paid inference settled on ADI, first anchored verification record	1M+ verified inferences, settlement reconciled, cost per 1M tokens published
13+	Scale. Open endpoint to external developers, grow cluster, list GNK-on-ADI with an ADGM-licensed venue	External developer signups, second workflow onboarded

Asks and open items

- Confirm ADI Chain VM/bridge model and the licensed entity that would custody GNK on ADI.
- Confirm datacenter capacity, GPU type and timeline (H200 or B200 preferred).
- Nominate one pilot workflow and one business owner on each side.
- Decide whether a strategic GNK investment sits alongside the operating partnership or follows it.
